### Research Summary

Deep Packet Inspection (DPI) is a sophisticated network technology used for analyzing and monitoring the contents of data packets as they traverse through a network. DPI examines the entire payload of each packet, including the application layer data, header information, and even encrypted content, to extract detailed information about the traffic. It can identify the type of applications and protocols being used, detect malware, filter and block specific content or websites, prioritize network traffic, and enforce security policies. DPI is commonly employed by network administrators, internet service providers, and cybersecurity organizations to gain insights into network traffic patterns, enhance network performance, and ensure compliance with security and regulatory requirements. However, the use of DPI has raised concerns about user privacy and potential misuse of data, leading to ongoing debates about balancing security needs with user rights.

The major global suppliers of Deep Packet Inspection (DPI) include Cisco Systems, International Business Machine (IBM), Intel, NortonLifeLock (Symantec), Palo Alto

Networks, Check Point Software Technologies, Extreme Networks, Netscout Systems, Procera Networks(Sandvine), Viavi Solutions, Allot Communications, Bivio Networks, Cpacket Networks, Enea, etc. The global players competition landscape in this report is divided into three tiers.
