Research Summary

Demineralized whey powder is a dairy ingredient derived from whey, the liquid left behind after milk is curdled and strained during cheese-making. It undergoes a process of demineralization, where a significant portion of the minerals, such as calcium and phosphorus, is removed, leaving behind a whey powder with reduced mineral content. The demineralization process is achieved through ion-exchange, electrodialysis, or similar methods. Demineralized whey powder is commonly used in the food and beverage industry as a functional ingredient, especially in infant formula, as it is easily digestible and contains essential nutrients like proteins, lactose, and various bioactive components. The reduced mineral content makes it suitable for specific applications where lower mineral levels are desired, such as in certain infant formulas or specialized dietary products.

The major global manufacturers of Demineralized Whey Powder include Euroserum, Valio, Lactalis, FrieslandCampina Domo, Dairy Crest, RENY PICOT, James Farrell, ALIMA Group, Hochwald, Mirel® Dairy Product, etc. The global players competition
