Research Summary

Dental implants are advanced restorative solutions used in dentistry to replace missing teeth by mimicking the structure of natural teeth and their roots. Consisting of a titanium or titanium alloy post that is surgically placed into the jawbone and an abutment that connects the post to a prosthetic crown, bridge, or denture, dental implants offer a sturdy and long-lasting foundation for tooth replacements. Over time, the implant fuses with the surrounding bone through a process called osseointegration, providing stability and support for the artificial tooth. Dental implants not only restore oral function, aesthetics, and confidence but also help maintain the integrity of the jawbone, making them a vital option in modern restorative dentistry.
