Research Summary

Dermal fillers and botulinum toxin are popular cosmetic treatments used to address different aspects of facial aging. Dermal fillers, composed of substances like hyaluronic acid, are injected to restore volume, soften wrinkles, and enhance facial contours. They work by plumping up areas with lost volume, such as cheeks, lips, and nasolabial folds. On the other hand, botulinum toxin, often referred to by its brand name Botox, is injected into muscles to temporarily paralyze them and reduce the appearance of dynamic wrinkles, like crow's feet and frown lines, by limiting muscle movement. Both treatments are non-surgical and can be used in combination to achieve a more comprehensive facial rejuvenation, addressing various aspects of the aging process.
