Research Summary

Dermal fillers are cosmetic products designed to enhance facial appearance by restoring lost volume, smoothing wrinkles, and improving contours. Typically composed of substances like hyaluronic acid, calcium hydroxylapatite, or polylactic acid, dermal fillers are injected beneath the skin's surface to address areas that have lost elasticity and fullness due to aging or other factors. These fillers can effectively reduce the appearance of lines, folds, and sagging skin, resulting in a more youthful and refreshed look. The procedure is minimally invasive, with effects often lasting several months to over a year, making dermal fillers a popular choice for individuals seeking a non-surgical approach to facial rejuvenation.
