### Research Summary

A dermal substitute is a biomaterial used in the field of wound care and tissue regeneration to replace or supplement damaged or missing skin layers. Typically used for severe burns, chronic wounds, or surgical reconstructions, dermal substitutes are designed to promote the healing process and provide a scaffold for new tissue growth. These substitutes can be made from various materials, including synthetic polymers or natural extracellular matrix components, and they often possess properties that aid in wound closure, reduce scarring, and support cell migration and tissue integration.
