Research Summary

Desulphurization gypsum, also known as FGD gypsum (flue gas desulfurization gypsum), is a byproduct generated from the process of reducing sulfur dioxide emissions in power plants and industrial facilities. During flue gas desulfurization, sulfur dioxide is captured from combustion gases using scrubbers or other technologies. The captured sulfur dioxide reacts with limestone or lime to form gypsum, which is then separated from the exhaust gases. Desulphurization gypsum is a valuable material that can be used in various applications, including as a soil amendment to improve soil structure and reduce nutrient leaching, as a component in cement production to control setting time, and as a raw material in the manufacturing of gypsum-based products like wallboard and plaster.

The major global manufacturers of Desulphurization Gypsum include Tuoketuo Power Station, Taichung Power Plant, Kashima Power Station, Belchat?w Power Station, Shoaiba Power Plant, Futtsu Power Station, Surgut-2 Power Plant, WA Parish Generating Station, Vindhyachal Thermal Power Station, Guohua Taishan Power Plant,
