### Research Summary

Deuterated ammonia, often represented as ND<sub>3</sub> or D<sub>3</sub>N, is a chemical compound where one or more of the hydrogen atoms in ammonia (NH<sub>3</sub>) are replaced with deuterium atoms, a stable isotope of hydrogen. Deuterium is similar to hydrogen but has an additional neutron in its nucleus, making it heavier. Deuterated ammonia is commonly used in nuclear magnetic resonance (NMR) spectroscopy as a solvent or as a reference standard. The substitution of hydrogen with deuterium alters the chemical properties of ammonia, particularly in terms of its NMR behavior. This makes deuterated ammonia useful for NMR studies, allowing researchers to analyze and identify compounds in solution with higher precision and accuracy. Deuterated ammonia is also utilized in isotopic labeling experiments and in certain chemical reactions where the presence of deuterium can affect reaction rates or selectivity. Additionally, it is used in some industrial processes and research applications where deuterium's unique properties are beneficial.

The major global manufacturers of Deuterated Ammonia include Taiyo Nippon Sanso, Linde Gas, etc. The global players competition landscape in this report is divided into
