### Research Summary

A development board is a hardware platform designed to facilitate the creation and testing of electronic projects, prototypes, and applications. It typically includes a microcontroller, microprocessor, or system-on-chip (SoC), along with various input/output interfaces, sensors, connectors, and often programmable components. Development boards provide a ready-to-use environment for developers, hobbyists, and engineers to experiment with hardware and software interactions, allowing them to write and test code, interface with peripherals, and create functional prototypes without designing circuits from scratch. These boards are commonly used in fields like embedded systems, Internet of Things (IoT), robotics, and electronics education, enabling faster and more efficient development and iteration of electronic projects.

The major global manufacturers of Development Board include STMicroelectronics, Analog Devices, Silicon Labs, Texas Instruments, Cypress Semiconductor, ARM, Adafruit, Renesas, Nordic Semi, Intel, etc. The global players competition landscape in this report is divided into three tiers.
