### Research Summary

Diaburs are specialized abrasive products used primarily in dental and medical fields for precise polishing and grinding of hard tissues, such as enamel, dentin, and bone. These tools typically consist of a small, rotating abrasive head that is used with a handpiece or other dental instruments. Diaburs are designed to deliver controlled abrasion with minimal heat generation and are available in various shapes, sizes, and grit levels to cater to different clinical needs. In dentistry, they are commonly employed for procedures like cavity preparation, crown and bridge adjustments, and root canal treatments. The high-quality abrasives used in Diaburs ensure that they provide a smooth, accurate finish without causing unnecessary damage to surrounding tissues. They are also used in other fields, such as precision manufacturing, where fine and controlled material removal is required.
