Research Summary

A diaphragm pacing device is a medical apparatus used to assist individuals with respiratory insufficiency by stimulating the diaphragm muscles to contract, facilitating the process of breathing. The device typically consists of electrodes implanted on the surface of the diaphragm or within the phrenic nerves, which transmit electrical impulses to initiate muscle contractions, replicating the natural breathing process. Diaphragm pacing devices are primarily employed for patients with spinal cord injuries, central sleep apnea, or other conditions that compromise the normal function of the respiratory muscles, helping to enhance lung function and overall respiratory efficiency.
