Research Summary

A diaphragm wall grab, also known as a trench cutter, is a heavy-duty construction machinery used in civil engineering and deep foundation projects. It is designed to create deep, vertical trenches or cut-off walls in soil or rock formations for various purposes such as building foundations, underground structures, and retaining walls. The diaphragm wall grab operates by utilizing a large mechanical arm equipped with cutting tools to excavate the trench in sections while simultaneously installing a support fluid (such as bentonite slurry) to stabilize the trench walls. This method allows for precise and controlled excavation in challenging soil and geological conditions, enabling the construction of deep and stable structures in urban areas or areas with limited space.
