### Research Summary

Dichlorosilane (chemical formula  $\text{SiH}_2\text{Cl}_2$ ), also known as dichloro hydrogen silicon, is a chemical compound consisting of silicon, hydrogen, and chlorine atoms. It is a colorless, flammable gas with a pungent odor and is highly reactive due to the presence of Si-H bonds. Dichlorosilane is commonly used as a precursor in the production of various silicon-based materials, such as silicones, silicon nitride, and polysilicon. In the semiconductor industry, it is a key raw material for depositing thin films of silicon dioxide ( $\text{SiO}_2$ ) and silicon nitride ( $\text{Si}_3\text{N}_4$ ) through chemical vapor deposition (CVD) processes. These thin films are essential for insulating and passivating semiconductor devices, such as integrated circuits (ICs), microchips, and photovoltaic cells. Due to its reactivity and flammability, dichlorosilane must be handled with care and stored under controlled conditions to prevent hazards such as fire or chemical reactions. Safety protocols and equipment such as specialized storage tanks, leak detection systems, and personal protective gear are necessary when working with dichlorosilane in industrial settings.

The major global manufacturers of Dichloro Hydrogen Silicon include Linde Group,
