Research Summary

A diesel locomotive transmission system is a complex arrangement of mechanical components used to transmit power from the diesel engine to the locomotive's wheels, enabling it to move and propel trains. These transmission systems vary based on locomotive design but often involve the use of a diesel engine that generates rotational power, which is then transferred to a gearbox or traction motors through a series of mechanical linkages or hydraulic systems. The gearbox or motors convert the engine's power into rotational motion for the locomotive's wheels, determining speed, torque, and direction. The transmission system in diesel locomotives is engineered to optimize performance, energy efficiency, and traction, ensuring the locomotive can efficiently transport heavy loads across rail networks while providing control over various operational conditions.

The major global manufacturers of Diesel Locomotive Transmission System include Voith, Siemens, CRRC, ZF Friedrichshafen, Hitachi Nico Transmission, etc. The global
