Research Summary

A Diesel Particulate Filter (DPF) is an emissions control device used in diesel engines to capture and reduce particulate matter, or soot, that is emitted as a byproduct of combustion. The DPF is typically located in the exhaust system and contains a porous ceramic filter that traps and stores these fine particles. As exhaust gases flow through the filter, particulates are captured, allowing cleaner gases to exit. Over time, the trapped particles build up, and to prevent clogging and maintain engine efficiency, the DPF goes through a regeneration process. This involves raising the exhaust temperature to burn off the accumulated soot, converting it into less harmful emissions like carbon dioxide and ash. DPFs play a crucial role in reducing harmful particulate emissions from diesel engines, contributing to improved air quality and compliance with stringent emissions standards.

The major global manufacturers of Diesel Particulate Filter (DPF) include Tenneco, BorgWarner, Freudenberg Filtration, Faurecia, Weifu, Donaldson, MANN+HUMMEL, EEC, Eberspacher, HUSS, Hug Engineering, Dinex, ESW Group, Bosal, Eminox, HJS
