### Research Summary

Dietary modified starch refers to a type of starch derived from various plant sources that has been chemically or physically modified to enhance its functional properties for specific food and beverage applications. Through processes such as enzymatic treatment, hydrolysis, or physical modification, the structure and properties of the starch molecules are altered to improve attributes like solubility, viscosity, stability, and texture. These modified starches find use in a wide range of food products, including soups, sauces, dressings, baked goods, dairy products, and processed meats. They serve as thickeners, stabilizers, binders, and texture enhancers, allowing food manufacturers to achieve desired product characteristics and improve sensory experiences while meeting formulation requirements.
