Research Summary

A Differential Scanning Calorimeter (DSC) is a sophisticated analytical instrument used in materials science and chemistry to measure the thermal properties of substances as they undergo heating or cooling processes. DSC works by comparing the heat flow of a sample and a reference material while subjecting them to controlled temperature changes. It detects energy changes associated with phase transitions, chemical reactions, melting, crystallization, and other thermal events. The resulting data provides insights into material characteristics like melting points, glass transition temperatures, heat capacities, and reaction kinetics. Differential Scanning Calorimeters are widely used to investigate polymers, pharmaceuticals, food products, metals, and various other materials, aiding in research, quality control, and process optimization across multiple industries.

The major global manufacturers of Differential Scanning Calorimeter (DSC) include TA Instruments, NETZSCH, Mettler-Toledo, Malvern, PerkinElmer, Shimadzu, Hitachi,
