Research Summary

Diffraction gratings are optical devices composed of closely spaced parallel lines or grooves etched onto a surface. They are used to disperse light into its component wavelengths, creating a spectrum that reveals the individual colors and their intensities. When light passes through a diffraction grating, the grooves cause light waves to interfere constructively or destructively, resulting in distinct orders of diffraction patterns. Gratings are crucial tools in spectroscopy, where they help analyze the composition and properties of light sources by separating the different wavelengths they emit or reflect. Diffraction gratings find applications in a range of fields, from analyzing the elemental composition of distant stars to identifying chemical compounds in laboratories, enabling scientists to gain insights into the properties of light and matter.

The major global manufacturers of Diffraction Gratings include HORIBA, MKS Instruments (Newport Corporation), Edmund Optics, Shimadzu Corporation, Kaiser Optical Systems, Lightsmyth (Finisar), Plymouth Grating Lab, Zeiss, Optometrics (Dynasil), Spectrogon, Headwall Photonics, Jenoptik, Spectrum Scientific, Photop
