### Research Summary

A diffractive beam shaper is an optical device designed to modify the spatial intensity distribution of a laser beam. It uses diffraction principles to reshape the laser beam profile, often converting it into a desired shape such as a top-hat, Gaussian, or flattop profile. This reshaping is achieved by using a diffractive optical element (DOE) that consists of micro-structured patterns etched onto a transparent substrate. When the laser beam passes through the DOE, the diffractive patterns diffract the light, redistributing its intensity across the beam profile. Diffractive beam shapers are used in various applications where precise control over the laser beam profile is essential, such as laser material processing, laser lithography, laser marking, and laser microscopy. They offer advantages such as high efficiency, flexibility, and the ability to generate complex intensity distributions with a single optical element.

The major global manufacturers of Diffractive Beam Shaper include Edmund Optics, Holo-OR, Wavelength Opto-Electronic, Altechna, Sintec Optronics, Jenoptik, Newport Corporation, II-VI Incorporated, SUSS MicroOptics, etc. The global players competition
