Research Summary

Disposable hemoperfusion is a medical treatment method used to remove toxins or unwanted substances from a patient's blood by passing it through an adsorbent material. This technique involves the use of a disposable cartridge or column containing adsorbent particles that can selectively bind to specific substances, such as drugs, toxins, or metabolic byproducts. The patient's blood is circulated through this cartridge, allowing the adsorbent material to capture the targeted substances from the blood. Disposable hemoperfusion is often employed in cases of drug overdose, poisoning, or certain medical conditions where traditional therapies are ineffective, offering a way to rapidly reduce the concentration of harmful substances in the bloodstream and improve patient outcomes.
