Research Summary

Distance measuring optical sensors are specialized devices that utilize optical principles to accurately measure the distance between the sensor and an object or surface. These sensors use various techniques such as time-of-flight, triangulation, or interferometry to determine the distance based on the interaction between emitted light or laser beams and the target object. The sensor measures the time it takes for the light to travel to the object and back, or analyzes the angle of reflection, allowing for precise distance calculations. Distance measuring optical sensors find applications in fields such as robotics, industrial automation, automotive, and consumer electronics for tasks like object detection, position control, and navigation, contributing to enhanced accuracy and efficiency in various technological applications.
