Research Summary

Distillation packings, also known as distillation column internals or tower packing, are structured materials used in distillation processes to enhance the separation of components in a liquid mixture. These packings are placed inside distillation columns and provide a large surface area for contact between vapor and liquid phases, facilitating efficient mass transfer and separation. They come in various shapes and configurations, such as random packing or structured packing, designed to create turbulence and promote the vapor-liquid interaction necessary for effective separation of components based on their boiling points. Distillation packings play a critical role in improving the performance of distillation columns used in industries such as petrochemicals, chemical engineering, and food and beverage, enabling the purification and fractionation of liquid mixtures with high precision.

The major global manufacturers of Distillation Packings include Sulzer, Koch-Glitsch, Raschig, RVT Process Equipment, HAT International, Sumitomo Heavy Industries, Montz, Haiyan New Century, Zehua Chemical Engineering, GTC Technology US,
