Research Summary

Distraction osteogenesis devices are medical instruments used in orthopedic and maxillofacial surgeries to gradually lengthen or reshape bones through controlled mechanical stress. This technique involves surgically cutting the bone and then applying tension to the bone segments using the distraction device. As the bone gradually heals, the device is adjusted at intervals to incrementally stretch the bone, allowing new bone tissue to form in the gap created. Distraction osteogenesis devices are employed in various procedures, including limb lengthening, correcting bone deformities, and craniofacial reconstructions. They offer a non-invasive way to achieve bone growth without the need for extensive grafting and can be customized based on the patient's needs, age, and medical condition, contributing to improved bone function and appearance.

The major global manufacturers of Distraction Osteogenesis Devices include KLS Martin Group, Johnson & Johnson, Stryker, Zimmer Biomet, Osteomed, Ningbo Cibei Medical Treatment Appliance, Jeil Medical, Titamed, Ortho Max Manufacturing, etc. The
