Research Summary

Divalproex sodium is a medication commonly used in the treatment of epilepsy and bipolar disorder. It is a compound that consists of sodium valproate and valproic acid, both of which have anticonvulsant properties. Divalproex sodium works by increasing the levels of gamma-aminobutyric acid (GABA) in the brain, a neurotransmitter that helps to reduce excessive neuronal activity. This medication is prescribed to manage various types of seizures in epilepsy and to stabilize mood fluctuations in bipolar disorder. It can be administered orally in the form of tablets or capsules. As with any medication, it can have potential side effects and requires careful monitoring under medical supervision.
