Research Summary

A doctor blade is a thin, flat, and typically flexible tool used in various printing and coating processes, such as in flexographic, gravure, and offset printing. It serves to control the amount of ink, paint, or other fluids applied to a substrate by wiping off excess material from the surface of a rotating cylinder or roller. Doctor blades are usually made from materials like steel, plastic, or composite materials and are positioned at a precise angle against the cylinder, ensuring uniform coverage and preventing ink buildup that could affect print quality. The proper adjustment and quality of the doctor blade's edge play a crucial role in achieving consistent and high-quality results in various printing and coating applications.
