Research Summary

Double lumen endobronchial tubes (DLTs) are specialized medical devices used in thoracic surgery and critical care to isolate and ventilate each lung independently. These tubes feature two separate lumens, each with its own cuff, allowing one to direct airflow to the left lung and the other to the right. This dual function is essential for procedures like lung resections, where one lung needs to be deflated for better surgical access while maintaining ventilation in the other. DLTs are typically inserted through the trachea and positioned into the bronchi, guided by imaging or a bronchoscope. They are critical for ensuring effective lung isolation, minimizing contamination, and supporting precise respiratory management during complex surgeries.
