Research Summary

A drainage catheter is a medical device used to alleviate the accumulation of fluids, such as blood or pus, from a specific area within the body. Typically inserted through a minimally invasive procedure, the catheter consists of a flexible tube that is carefully positioned within the body to allow the fluid to be effectively drained away from an internal site to an external collection bag or reservoir, aiding in the management of conditions such as abscesses, fluid buildup in body cavities, or postoperative drainage requirements. This helps reduce discomfort, prevent infection, and promote the body's healing process by facilitating the controlled removal of excess fluids.
