Research Summary

Drug-eluting stents (DES) are medical devices used in the treatment of coronary artery disease. They are tiny, wire mesh tubes that are implanted in narrowed or blocked coronary arteries during a procedure called percutaneous coronary intervention (PCI) or angioplasty. What sets DES apart from traditional bare-metal stents is their coating with a medication, usually an anti-proliferative drug, that is slowly released over time. This drug helps inhibit the growth of cells that can lead to restenosis (re-narrowing) of the treated artery. By combining the mechanical support of the stent with the therapeutic effects of the drug, DES have significantly reduced the rate of restenosis compared to bare-metal stents. They play a crucial role in improving blood flow to the heart and reducing the need for repeat procedures in patients with coronary artery disease.

The major global manufacturers of Drug Eluting Stents (DES) include Abbott Vascular, Advantec Vascular, B.Braun Melsengen, Biosensors, Biotronik, Blue Medical, DISA Vascular, Boston Scientific, Essen, Medtronic Vascular, MicroPort Medical, MIV Therapeutics, Promed Medical, Orbusneich, Relisys Medical, Reva Medical,
