Research Summary

A drum brake system is a mechanical braking arrangement commonly used in vehicles to slow down or stop their motion. It consists of brake drums, which are circular metal housings mounted on the wheels, and brake shoes with friction linings attached inside the drum. When the brake pedal is pressed, hydraulic force is transmitted to push the brake shoes against the inner surface of the drum, creating friction and decelerating the vehicle. Drum brake systems are known for their simplicity and cost-effectiveness, although they are less efficient at dissipating heat compared to disc brakes. They are commonly used in the rear wheels of many vehicles and are gradually being phased out in favor of disc brake systems, which offer better performance and heat dissipation characteristics.

The major global manufacturers of Drum Brake System include ZF TRW, Mando Corporation, Akebono Brake Industry, Aisin Seiki, Continental, CBI, Nissin Kogyo, APG, Knorr-Bremse, CCAG, XinYi, TAIFENG, Shandong Aoyou, etc. The global players competition landscape in this report is divided into three tiers.
