Research Summary

Dry film photoresist is a photosensitive material used in the fabrication of printed circuit boards (PCBs), semiconductor devices, and other microelectronics applications. It is a thin, light-sensitive polymer film that is coated onto a substrate, such as a PCB or a silicon wafer. After exposure to ultraviolet (UV) light through a photomask, the areas exposed to light become insoluble, while the unexposed areas remain soluble. The film is then developed, removing the soluble portions and leaving behind a patterned resist layer. This pattern acts as a protective mask during subsequent processes like etching, plating, or deposition, allowing precise transfer of the pattern to the underlying substrate. Dry film photoresist offers advantages such as ease of handling, reduced waste, and the ability to create intricate patterns, making it a crucial tool in modern microfabrication and electronics manufacturing.

The major global manufacturers of Dry Film Photoresist include Asahi Kasei, Eternal, Showa Denko Materials, Chang Chun Group, Dupont, Kolon Industries, etc. The global players competition landscape in this report is divided into three tiers. The first tier

comprises global leading enterprises that command a substantial market share, hold a dominant industry position, possess strong competitiveness and influence, and generate significant revenue. The second tier includes companies with a notable market presence and reputation; these firms actively follow industry leaders in product, service, or technological innovation and maintain a moderate revenue scale. The third tier consists of smaller companies with limited market share and lower brand recognition, primarily focused on local markets and generating comparatively lower revenue.
