Research Summary

Dry type reactors are electrical components used in power systems to limit current, control voltage, and manage power flow without the use of liquid insulation or cooling. These reactors are constructed with air or solid insulating materials like epoxy or resin, making them low-maintenance, environmentally friendly, and suitable for indoor and outdoor applications. Commonly used in electrical substations, industrial plants, and renewable energy systems, dry type reactors help improve system stability, reduce harmonics, and protect equipment by controlling fault currents and regulating power quality. Their robust design ensures reliable operation in harsh conditions, contributing to the efficiency and safety of modern electrical networks.
