Research Summary

A Dural Repair Patch is a medical device used in neurosurgery to repair and seal dural defects or tears in the dura mater, the tough outer membrane covering the brain and spinal cord. These patches are typically made from biocompatible materials such as synthetic polymers or biological tissues that adhere securely to the dura mater, preventing cerebrospinal fluid leakage and protecting the underlying neural tissues. Dural repair patches are essential in surgical procedures such as craniotomy (opening of the skull) and spinal surgery, where access to the brain or spinal cord requires temporary removal of sections of the dura mater. The patches are designed to be flexible, durable, and easily conformable to the contours of the dura mater, ensuring effective closure of the surgical site and promoting proper healing. Advanced versions may include features like bioactive coatings to enhance tissue integration and reduce the risk of complications. Dural repair patches play a critical role in ensuring the success and safety of neurosurgical interventions by providing reliable closure of dural defects.
