### Research Summary

Dynamic sealing refers to the process of maintaining a tight and effective seal between moving components or surfaces in mechanical systems, such as pumps, engines, and hydraulic systems. Unlike static sealing, where components remain stationary, dynamic sealing involves sealing solutions for parts that are in motion, like rotating shafts, reciprocating pistons, or sliding doors. Effective dynamic seals are crucial for preventing the leakage of fluids, gases, or contaminants and ensuring the proper functioning and efficiency of these mechanical systems. Dynamic sealing mechanisms can include a variety of technologies, such as O-rings, gaskets, lip seals, and mechanical seals, each designed to handle specific applications and environmental conditions, and often require materials and designs that accommodate the wear and friction associated with moving parts while maintaining a leak-free barrier.

The major global manufacturers of Dynamic Sealing include John Crane, EagleBurgmann, Flowserve, AESSEAL, Garlock, Sinoseal, Vulcan Seals, Colossus, KSB, Meccanotecnica Umbra, Oerlikon Balzers, Sulzer, Flexaseal, Chesterton, Ekato,

Xi'an Yonghua, James Walker, Fluiten, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading enterprises that command a substantial market share, hold a dominant industry position, possess strong competitiveness and influence, and generate significant revenue. The second tier includes companies with a notable market presence and reputation; these firms actively follow industry leaders in product, service, or technological innovation and maintain a moderate revenue scale. The third tier consists of smaller companies with limited market share and lower brand recognition, primarily focused on local markets and generating comparatively lower revenue.
