Research Summary

An E-passport, also known as an electronic passport, is a modernized version of a traditional paper passport that includes an embedded microchip containing biometric data, such as facial recognition information and fingerprints. This technology enhances passport security, making it more resistant to counterfeiting, and simplifies the process of identity verification for border control authorities. On the other hand, an E-visa, or electronic visa, is a digital travel authorization that allows foreign travelers to obtain a visa for entry into a specific country electronically, typically through an online application process. E-visas streamline the visa application process by eliminating the need for physical visa stamps or stickers in passports, as the approval is linked to the traveler's passport electronically. Both E-passports and E-visas represent advancements in travel documentation and immigration procedures, aimed at enhancing security and convenience for international travelers.
