Research Summary

An E-passport, short for electronic passport, is a modern and secure version of a traditional paper passport that incorporates an embedded microchip containing biometric information about the passport holder, such as facial recognition data and fingerprints. This technology enhances the passport's security by making it more difficult to counterfeit and provides a convenient way for immigration authorities to verify the traveler's identity. E-passports typically feature a standard paper booklet with a visible chip symbol on the cover and are used by many countries worldwide as a standard travel document, facilitating smoother and more efficient border control processes at airports and other entry points.

The major global manufacturers of E-passport include Gemalto N.V.
