Research Summary

An Earthing Lightning Protection System is a critical safety infrastructure designed to safeguard structures and their occupants from the destructive forces of lightning strikes. It primarily consists of a network of conductive materials like copper or aluminum rods, cables, and grounding electrodes that are strategically installed on or around a building or facility. The system's main objective is to provide a safe and efficient path for the electrical discharge of lightning into the ground, thereby preventing damage to the structure and reducing the risk of fire, electrical damage, and personal injury. When a lightning strike occurs, the system conducts the electrical energy safely into the earth, where it dissipates harmlessly. Properly designed and installed Earthing Lightning Protection Systems are crucial for protecting both residential and commercial properties, as well as critical infrastructure, such as telecommunication towers and power substations, from the devastating consequences of lightning strikes.
