Research Summary

Electrodeposited (ED) copper foil for PCBs is a high-purity copper material produced through an electroplating process, where copper is deposited onto a rotating drum and then peeled off as a thin, flexible sheet. This type of copper foil is widely used in the fabrication of printed circuit boards (PCBs) due to its excellent electrical conductivity, adhesion properties, and mechanical strength. ED copper foil serves as the conductive layer in PCBs, enabling the formation of precise circuit patterns essential for electronic signal transmission. It is especially suited for multilayer and high-frequency PCBs, offering advantages such as cost-efficiency, consistent thickness, and compatibility with various substrate materials.
