Research Summary

Eddy current separators are specialized magnetic separators used in recycling and materials recovery processes to remove non-ferrous metals from a mixture of materials, such as shredded scrap, industrial waste, or electronic waste. These separators utilize the principle of eddy currents, which are created when a rapidly changing magnetic field interacts with conductive materials like aluminum and copper. As the material mixture moves along a conveyor belt, the eddy current separator generates a variable magnetic field that induces electrical currents in the non-ferrous metals. These induced currents create their own magnetic fields, opposing the original field, and causing the non-ferrous metals to be repelled and propelled out of the material stream, allowing for their separation from other materials. Eddy current separators play a vital role in recycling and resource recovery, as they enable the efficient extraction of valuable non-ferrous metals while reducing contamination in recycled materials.

The major global manufacturers of Eddy Current Separators include STEINERT, Wendt Corporation, LONGi Magnet, Eriez Manufacturing, Bunting Magnetics (Master
