Research Summary

An electric breast pump is a specialized medical device designed for lactating individuals, particularly new mothers, to express and collect breast milk. Unlike manual breast pumps that require hand-operated suction, electric breast pumps use an electric motor to create a rhythmic suction motion, efficiently drawing milk from the breast. These devices offer adjustable speed and suction strength settings, making them highly customizable to suit the individual's comfort and milk flow. Electric breast pumps are commonly used to facilitate breastfeeding for working mothers, to provide milk for infants in cases of medical necessity, or to maintain milk supply when the mother and baby are separated. They offer convenience, efficiency, and flexibility, making them a valuable tool for nursing mothers to express and store breast milk.
