### Research Summary

An Electric Double Layer Capacitor (EDLC), also known as a supercapacitor or ultracapacitor, is an electrical energy storage device that differs from traditional capacitors and batteries. It stores electrical energy by separating positive and negative charges at the interface between a solid electrode and an electrolyte solution. EDLCs have a very high surface area in the electrode materials, allowing them to store a significant amount of energy electrostatically, without chemical reactions. These capacitors are known for their rapid charge and discharge capabilities, making them ideal for applications requiring quick bursts of power, energy recovery, and peak load leveling in various industries, such as automotive, renewable energy, and consumer electronics. EDLCs are valued for their longevity, high efficiency, and ability to function over a wide temperature range, making them a key component in energy storage solutions.
