Research Summary

Electroactive polymers (EAPs) are a class of smart materials that change their shape, size, or mechanical properties in response to electrical stimulation. These materials, which are often made from flexible and lightweight polymers, exhibit electroactive behavior due to the application of an electric field. EAPs can be categorized into two main types: dielectric elastomers and conducting polymers. Dielectric elastomers change their shape when an electric field is applied, while conducting polymers alter their conductivity. Electroactive polymers have a wide range of applications, including in artificial muscles, sensors, actuators, haptic feedback devices, and even as components in flexible electronics. Their unique ability to convert electrical energy into mechanical motion or other useful responses makes them valuable in various fields, from robotics to biomedical devices.

The major global manufacturers of Electroactive Polymers include Solvay, 3M, RTP Company, Parker Hannifin, Sumitomo Chemical, Premix, Heraeus Group, The Lubrizol Corporation, PolyOne Corporation, Covestro, Cabot, Celanese, Rieke Metals, Merck
