Research Summary

Electrochlorination systems are specialized water treatment systems that use an electrochemical process to generate sodium hypochlorite or chlorine gas for disinfection and water purification. In these systems, salt and water are introduced into an electrolytic cell, and when an electrical current is applied, the chloride ions from salt are converted into hypochlorite ions or chlorine gas, which are powerful disinfectants. These systems are widely used in water treatment plants, swimming pools, and various industrial applications to efficiently and safely provide a consistent source of disinfection without the need for handling and storing hazardous chlorine chemicals.

Electrochlorination systems are environmentally friendly, cost-effective, and highly effective at killing bacteria, viruses, and other pathogens, making them a crucial component in ensuring the safety and quality of drinking water and wastewater treatment.

The major global manufacturers of Electrochlorination Systems include De Nora, Evoqua, ACG, MIOX, Kemisan, HADA Intelligence Technology, Bio-Microbics, Weifang
