### Research Summary

Electrodeionization (EDI) systems are advanced water purification technologies used to produce ultrapure water with high levels of deionization, typically in industries such as pharmaceuticals, microelectronics, and power generation. EDI combines principles of both ion-exchange resins and electrodialysis. In an EDI system, a stack of ion-exchange membranes alternated with ion-selective resin beads is used. When an electric field is applied, ions in the water are attracted to the oppositely charged ion-exchange materials. Cations migrate through the cation-exchange resin, while anions pass through the anion-exchange resin, effectively removing ions from the water. EDI systems provide a continuous and chemical-free method for producing purified water, eliminating the need for chemical regeneration and minimizing waste production. They are known for their high efficiency, cost-effectiveness, and consistent water quality, making them valuable in various industries where stringent water quality standards are essential.

The major global manufacturers of Electrodeionization (EDI) Systems include Veolia,

Suez, Ovivo, Evoqua, Kurita Water, Rightleder, Mega, Pure Water No.1, Hongsen Huanbao, Mar-Cor Purification, Nalco, Applied Membranes, AES Arabia, etc. The global players competition landscape in this report is divided into three tiers.
