Research Summary

An Electrodialysis Reversal (EDR) system is a water treatment technology that builds upon the principles of electrodialysis. EDR systems are specifically designed for desalination and ion removal from water sources, particularly in applications where the water quality is critical. EDR works by employing ion-selective membranes and an electric field to separate ions in a solution, with the added feature of periodic reversal of the electric field's polarity. This reversal helps to prevent the accumulation of ions on the membranes, which can cause scaling or fouling. By periodically reversing the electric field, EDR systems maintain the effectiveness of ion removal and extend the operational life of the membranes. Electrodialysis reversal is widely used in industries where precise water quality control is essential, such as in pharmaceutical manufacturing, power generation, and the production of high-purity process water for various applications.

The major global manufacturers of Electrodialysis Reversal System include PCCell GmbH, Evoqua Water Technologies LLC, GE Water & Process Technologies, C-Tech
