Research Summary

An electromagnetic surgical navigation system is a sophisticated medical technology that combines electromagnetic tracking and real-time imaging to aid surgeons in performing minimally invasive procedures with precision. It involves placing small, wireless sensors on surgical instruments or within the patient's body, which interact with electromagnetic fields generated by the navigation system. This enables continuous tracking and precise localization of the instruments and the patient's anatomy during surgery. The system provides visual feedback, often in the form of 3D images or models, that guides surgeons in navigating through complex anatomical structures, assisting in the accurate placement of instruments and improving surgical outcomes. Electromagnetic surgical navigation systems are valuable tools for procedures such as laparoscopy, neurosurgery, and orthopedic surgery, enhancing surgical accuracy, reducing invasiveness, and minimizing patient risk.

The major global manufacturers of Electromagnetic Surgical Navigation System include
