### Research Summary

An electronic spirometer is a medical device used to measure lung function by assessing the volume and flow of air that a patient inhales and exhales. It typically consists of a mouthpiece connected to a sensor that records the airflow and a display screen that shows the results. When a patient breathes into the mouthpiece, the spirometer measures parameters such as forced vital capacity (FVC), forced expiratory volume in one second (FEV1), and peak expiratory flow rate (PEFR). These measurements help healthcare professionals diagnose and monitor respiratory conditions such as asthma, chronic obstructive pulmonary disease (COPD), and restrictive lung diseases. Electronic spirometers offer advantages over traditional spirometers, such as digital data storage, ease of use, and the ability to integrate with electronic medical records for efficient patient management.

The major global manufacturers of Electronic Spirometer include Vyair Medical, Schiller, CHEST. MI., MIR, Vitalograph, MGC, Futuremed, Fukuda Sangyo, Cosmed, Medikro, ndd Medical, M&B Electronic, Benson Medical, CONTEC, etc. The global
