Research Summary

An Electronic Total Station is a sophisticated surveying and measurement instrument widely used in fields such as construction, civil engineering, and land surveying. It combines the functions of a theodolite (for measuring angles) and an electronic distance measuring device (for measuring distances) into a single integrated system. Electronic Total Stations employ advanced technology, including electronic angle measurement, laser distance measurement, and data processing capabilities. They allow surveyors and engineers to accurately and efficiently measure distances, angles, and coordinates of points on the ground, enabling the precise mapping and layout of structures, land parcels, and infrastructure. Electronic Total Stations have greatly improved the speed and accuracy of surveying and construction tasks, making them indispensable tools in the modern construction and surveying industry.

The major global manufacturers of Electronic Total Station include SOUTH, FOIF, TJOP, DAD, BOIF, Leica, Topcon, Trimble, etc. The global players competition landscape in this report is divided into three tiers.
