Research Summary

Electronic Volume Correctors (EVC) are electronic devices used in the oil and gas industry to measure and correct the volume of gas or liquid passing through pipelines. These devices are designed to compensate for variations in temperature, pressure, and other environmental factors that can affect the accuracy of volume measurements. EVCs are typically installed at various points along a pipeline to ensure that the quantity of gas or liquid being transferred is accurately measured and corrected to standard conditions, typically at a reference temperature and pressure. This correction process is essential for billing, custody transfer, and regulatory compliance, making EVCs critical components in the accurate accounting of gas and liquid flow in the energy sector.
