Research Summary

Electroretinography (ERG) is a diagnostic technique used in ophthalmology to assess the electrical activity of the retina, which is the light-sensitive tissue at the back of the eye. During an ERG, a patient's eyes are exposed to flashes of light, and electrodes placed on the cornea or skin near the eyes measure the resulting electrical responses generated by the retinal cells. ERG provides valuable information about the overall health and function of the retina, aiding in the diagnosis and monitoring of various retinal disorders, including retinal degeneration, diabetic retinopathy, and certain inherited eye conditions. This non-invasive and painless test assists ophthalmologists in understanding the status of retinal function and guiding treatment decisions, making it an essential tool in the field of ophthalmology.

The major global manufacturers of Electroretinography include LKC Technologies, Diagnosys LLC, Electro-Diagnostic Imaging, Diopsys,, Roland-consult, Metrovision, CSO Italia, etc. The global players competition landscape in this report is divided into three tiers.
