### Research Summary

Electrospun fiber is an ultra-fine fiber produced through the electrospinning process, where a polymer solution or melt is subjected to a high-voltage electric field, causing it to stretch and form fibers with diameters ranging from nanometers to micrometers. These fibers have a high surface area-to-volume ratio, excellent porosity, and tunable mechanical properties, making them suitable for a wide range of applications. Electrospun fibers are widely used in fields such as tissue engineering, drug delivery, filtration, protective textiles, and energy storage. Their versatility, combined with their ability to be engineered at the nanoscale, makes electrospun fibers an essential material in various high-performance and biomedical applications.

The major global manufacturers of Electrospun Fiber include HIFYBER, Donaldson, SPUR, Zeus, NanoLayr, Lerune (Qingdao) Textile Technology, Pardam Nano4fibers, Shandong Bluefuture New Material, Kuncheng New Materials, Sanmenxia Yuantong Nanomaterials, etc. The global players competition landscape in this report is divided into three tiers.
